

CE 430, Homework 1

Q1

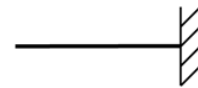

For the structures shown below, specify if they are determinate, indeterminate (and to what degree), or unstable.
(Note: open circle denotes a pin.)

Roller support

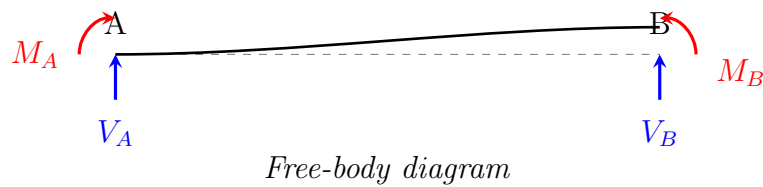

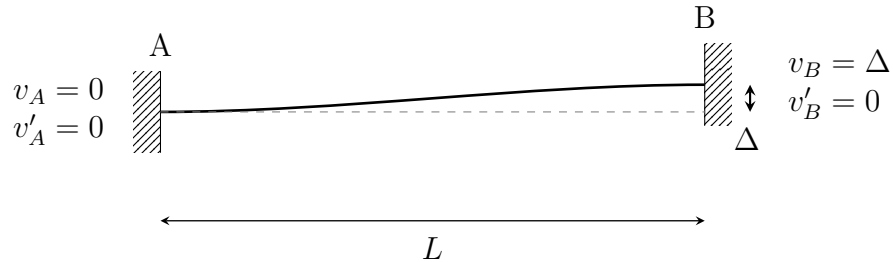

Pin support

Fixed end

Q2

Using the same approach as in class, derive the moment function $M(x)$ and the shear function $V(x)$ for the relative displacement in a flexural member, as shown, where x is the horizontal coordinate measured from end A : $x = 0$ at A and $x = L$ at B .

Q3

Again using the same approach as in class, verify the fixed-end moments for the load case below. Also derive the moment function $M(x)$ and the shear function $V(x)$, using the same coordinate convention: $x = 0$ at A and $x = L$ at B .
